

## I. What language is used by the `tutodoc` class?

This documentation loads the `babel` package via `\usepackage[english]{babel}` a package that `tutodoc` does not load. On the other hand, the `tutodoc` class identifies `en` as the main language used by `babel`.<sup>1</sup> As this language is included in the list of languages taken into account, see below, the `tutodoc` class will produce the expected effects. «API-LANGS»

### Note.

*Packages `babel` and `polyglossia` are taken into account.*

### Caution.

*If the choice of main language is not made in the preamble, the mechanism used will fail with unintended side effects (see warning that follows).*

### Warning.

*When a language is not supported by `tutodoc`, a warning message is issued, and *English* is selected as the language for `tutodoc`.*

---

<sup>1</sup>Technically, we use `\BCPdata{language}` which returns a language in short format.
