

## Break.

- Format: the `scrartcl` class replaces the venerable `article`. This implies better placement of the margin notes with the options retained for loading `scrartcl`.
- $\text{\LaTeX}$  code: the macro `\tdocinlatex` has been renamed `\tdoclatexin`.
- Color key names will be hyphenated where necessary: this implies the following changes.
  1. Admonitions: the `colchges` option of the environments has been renamed `col-chges`.
  2. Showcases: for the environment `tdocshowcase` and the macro `\tdocshowcaseinput`, the `colstripe` and `coltext` options have been renamed `col-stripe` and `col-text`.

## Fix.

- Admonitions: for the `\newkeytheorem` used with the draft theme, `postheadhook =` has been added (this is necessary because the content can naturally be of the list type).

## New.

- Documentation: addition of a section listing dependencies.
- Class options.
  1. Options not specific to `tutodoc` are passed on to the class in charge of general formatting.
  2. The `scrartcl` options `fontsize` and `DIV` can't be used because their values are fixed by `tutodoc`.
- The macro `\tdocinEN` respects the English linguistic rules.
- Admonitions.
  1. A new environment `\begin{tdoctodo}...\end{tdoctodo}` has been added.
  2. Each environment has a new option `col` for the color of the content indicating changes.

## Update.

- Documentation: the theme gallery uses a better fake example.

## Technical information.

- Simplified organisation of configuration files in the final project.
  1. CSS-like: use of one file per theme with a name like `tutodoc-bw.css.cls`.
  2. Locale: use of names like `tutodoc-en.loc.cls`.
