

I. What language is used by the `tutodoc` class?

This documentation loads the `babel` package via `\usepackage[english]{babel}`. As a result, the `tutodoc` class identifies `en` as the main language used by `babel`.¹ As this language is included in the list of languages taken into account, see below, the `tutodoc` class will produce the expected effects. «LANG-SUPPORTED»

Caution.

If the choice of main language is not made in the preamble, the mechanism used will fail with unintended side effects (see warning that follows).

Warning.

When a language is not supported by `tutodoc`, a warning message is issued, and English is selected as the language for `tutodoc`.

Note.

The mechanism used should be compatible with the `polyglossia` package.

¹Technically, we use `\BCPdata{language}` which returns a language in short format.
