

I. What language is used by the `tutodoc` class?

This documentation loads the `babel` package via `\usepackage[english]{babel}`. As a result, the `tutodoc` class identifies `en` as the main language used by `babel`.¹ As this language is included in the list of languages taken into account, see below, the `tutodoc` class will produce the expected effects. «LANG-SUPPORTED»

Important.

If the choice of main language is not made in the preamble, the mechanism used will fail with unintended side effects (see warning that follows).

Caution.

If the choice of main language is not made in the preamble, the mechanism used will fail with unintended side effects (see warning that follows).

Warning.

When a language is not supported by `tutodoc`, a warning message is issued, and English is selected as the language for `tutodoc`.

Note.

The mechanism used should be compatible with the `polyglossia` package.

¹Technically, we use `\BCPdata{language}` which returns a language in short format.
