## 1. Without a colour strip

The rendering of \begin{tdocshowcase} ...\end{tdocshowcase} with a coloured strip may not be suitable, or sometimes may not be acceptable despite the work done by clrstrip. It is possible not to use a coloured strip, as we will see straight away.

Example 1. The use of  $\begin{tous blue} tdocshowcase \end{tous blue} [nostripe] ... \end{tdocshowcase} indicate to not use clrstrip. Here is an example.}$ 

```
\begin{tdocshowcase}[nostripe]
                       \ensuremath{\setminus} end\{tdocshowcase\}
 This will produce the following.
                                                                                                                                                         Start of the real output
End of the real output
Example 2 (Change the default colour and/or text).
        \begin{tabular}{l} \begin{tabu
                                                                                                before = My beginning,
                                                                                                after = My end,
                                                                                                color = green]
                        \end{tdocshowcase}
 This will produce the following.
                                                                                                                                                                                ■ My beginning
```

 $\blacksquare$  My end  $\blacksquare$
